DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed March 2, 2007 have been fully considered but they are not persuasive. Durham teaches all of the newly added limitations. Durham teaches a clock generator (27) generating a constant maximum internal frequency. He also teaches a pulse filter (1-7, 10-13, 20) for filtering clock pulses from said clock signal (19) from said clock generator (27). He also teaches a control device (21, 14-17) that provides a control signal (output from 16 and 17) to said control input of said pulse filter, where the pulse filter has a filtered clock signal being provided at the output (system_clock). Durham also teaches the pulse filter suppressing individual clock pulses (via 7) of the clock generator (27) in response to the control signal at the control input (from the control device).

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later

Art Unit: 2836

invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1, 3, 4, 6, 7, and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over 3. Durham et al. (5,761,517) and Wang (5,943,203). Durham teaches a current measuring device (18), a controllable clock supply circuit (27, 19, 1-7, 10-13, 20) having an output with filtered clock pulses to be connected to a clock input of the circuit configuration (20, system clock), and a clock generator (27) generating a constant maximum internal frequency. He also teaches a control device (21 & 14-17), connected to and controlling a pulse filter (1-7, 10-13, 20), which drives the filtered clock (via control signals sent via 16 and 17) based upon the measured current consumption (via sensor, 18). He also teaches the pulse filter (1-7, 10-13, 20) suppressing individual clock pulses of the clock generator (27), when a high power condition is detected (via sensor, 18), in response to the control signal at the pulse filter's control input (new data of registers 10-13). It is inherent to detect if such a condition exists, to have a definable threshold value and to see if the measured value exceeds it. (Abstract; Col. 1, lines 53-59; Col. 6, lines 24-52; Fig. 1A&B) Durham fails to explicitly teach the sensor being instantaneous and how the sensor (18) determines that a high power condition exists. Wang teaches a current being measured by an instantaneous current sensor and then compared with a threshold value by a comparator to determine if an over-current state has occurred (Col. 4, lines 14-19). It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate Wang's method of determining over-current into Durham's invention since Durham doesn't teach how it is determined and Wang teaches a method known in the art. It also would have been obvious to one of ordinary skill in the art at the time of the invention to use an

Art Unit: 2836

instantaneous current sensor in Durham's invention to allow for more accurate measurements of the current and more precise control of the clock's frequency.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dru M. Parries whose telephone number is (571) 272-8542. The examiner can normally be reached on Monday -Thursday from 9:00am to 6:00pm. The examiner can also be reached on alternate Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Sherry, can be reached on 571-272-2800 x 36. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
